

Sales Performance Overview – Business Requirement Document

Objective

The aim of this project is to design an interactive Power BI dashboard that presents a clear and executive-level view of sales performance across Ghana, Kenya, Nigeria, and South Africa. The dashboard is intended to support monitoring, comparison, and data-driven business decisions.

Business Problem

The raw dataset contains customer information, distributor records, product details, sales representatives, and transaction-level sales data. However, in its unstructured form, it does not provide decision-makers with a clear view of trends, customer behavior, regional performance, category strength, or business targets.

Required Capabilities

- Track revenue KPIs and core business metrics.
- Monitor monthly and yearly sales movement.
- Compare country contribution and regional performance.
- Analyze retail and wholesale customer behavior.
- Understand category contribution and business dependency.
- Evaluate sales representative effectiveness.
- Compare actual revenue against target performance.
- Support interactive filtering and user-driven exploration.

Expected Dashboard Outcome

The final dashboard should provide a clean, understandable, and visually balanced reporting experience. It should support storytelling, interactive filtering, executive KPI tracking, and deeper business analysis without overwhelming the user.

Requirement Mapping

Requirement	Purpose
Revenue KPIs	Track overall business performance.
Trend Analysis	Understand sales movement over time.
Country Performance	Compare regional contribution.
Customer Segmentation	Analyze customer-type behavior.
Category Analysis	Identify strongest product groups.

Sales Rep Analysis	Evaluate team efficiency.
Target Tracking	Monitor progress against business goals.
Interactive Filtering	Enable dynamic business exploration.
